

2-Hour Session Plan

Introduction to Business Analysis

Session Objective

Understand:

- Who is a Business Analyst
 - Responsibilities of a Business Analyst
 - Important Business Analyst skills
 - Agile and Waterfall methodologies
 - Stakeholder management
 - Real-time business examples
 - Career opportunities in Business Analysis
-

1. Definition and Responsibilities of a Business Analyst

What is a Business Analyst?

A Business Analyst (BA) is a person who understands business problems and helps companies find solutions using technology, data, and process improvements.

Business Analyst acts as a bridge between:

- Business team
 - Technical/Development team
-

Real-Time Example – Hospital

Problem:

Patients wait too long for appointments.

Business Analyst:

- Talks with hospital staff
- Understands the problem
- Collects requirements
- Suggests online appointment system

Result:

- Faster appointments
 - Better patient experience
-

Responsibilities of a Business Analyst

1. Requirement Gathering

Collect business needs from clients or users.

Example:

Understanding what features company needs in software.

2. Analyzing Business Problems

Find business issues and identify solutions.

Example:

Manual reporting taking too much time.

3. Communication Between Teams

BA explains requirements to developers and management.

4. Documentation

Prepare:

- Requirement documents
 - Reports
 - Process flow documents
-

5. Process Improvement

Suggest better and faster ways of working.

2. Key Skills for Business Analysts

A. Communication Skills

Business Analysts communicate with:

- Clients
- Managers
- Developers
- Users

Example

Explaining customer requirements to technical team.

B. Analytical Thinking

Ability to:

- Study data
- Understand problems
- Analyze business processes

Example

Analyzing why company sales decreased.

C. Problem-Solving Skills

Finding solutions to business problems.

Example

Replacing manual reports with automated dashboards.

D. Documentation Skills

Preparing:

- Reports
 - Requirement documents
 - Meeting notes
-

E. Basic Technical Skills

Business Analysts often use:

- Excel
 - SQL
 - Power BI
-

Real-Time Example – E-commerce Company

Problem:

Customers complain about delayed delivery.

Business Analyst:

- Analyzes delivery data
- Talks with operations team
- Identifies delays
- Suggests better tracking system

Result:

- Faster delivery
 - Improved customer satisfaction
-

3. Business Analysis Methodologies

Methodology means the process followed to complete a project.

A. Waterfall Methodology

Step-by-step process.

Stages

1. Requirement gathering

2. Design
3. Development
4. Testing
5. Deployment

Each stage completes before next stage starts.

B. Agile Methodology

Agile develops projects in small parts with continuous feedback.

Example – Food Delivery App

Features added regularly:

- Live tracking
- Offers
- Wallet system

Changes can happen anytime.

Agile Methodology – Real-Time Example with Big Billion Days Sale

During events like the , companies continuously update their applications and features quickly.

This is where Agile methodology is useful.

How Agile Works in Big Billion Days

Before the sale:

- Company plans offers
- Developers create features

- Testing team checks updates

But during the sale, requirements may change quickly.

Real-Time Agile Situations

Example 1 – Flash Sale Feature

Company suddenly wants:

- “Flash Sale for 1 Hour”

Development team quickly develops and deploys feature.

Example 2 – Payment Issue

Customers face payment failures.

Agile team:

- Fixes issue quickly
 - Deploys update immediately
-

Example 3 – Server Load

Website becomes slow due to heavy traffic.

Team continuously:

- Monitors servers
 - Improves performance
 - Releases updates
-

Why Agile is Best Here

Because:

- Requirements change frequently
 - Continuous updates are needed
 - Customer feedback comes quickly
 - Fast problem solving is required
-

Agile Process in Big Billion Days

1. Small feature planned
2. Developed quickly
3. Tested
4. Released
5. Customer feedback collected
6. Improvements made again

This cycle continues continuously.

Waterfall Methodology – Real-Time Examples

Waterfall works best when requirements are fixed and changes are very less.

Example 1 – ATM Software System

Bank decides fixed requirements:

- Cash withdrawal
- Balance check
- Mini statement
- PIN change

Development happens step-by-step:

1. Requirement gathering
2. Design
3. Development
4. Testing
5. Deployment

Once completed, changes are difficult.

Example 2 – College Management System

College wants:

- Student registration
- Attendance
- Fee management
- Exam reports

Requirements are already fixed.

So Waterfall works well because:

- Everything is planned earlier
- Less changes occur later

Simple Difference with Examples

Agile	Waterfall
Flexible	Fixed
Continuous updates	Step-by-step process
Used in e-commerce apps	Used in banking/government systems
Best for changing requirements	Best for fixed requirements

Easy Conclusion

Agile

Used when:

- Fast changes happen
- Continuous updates are needed
- Customer feedback is important

Example:

- Online shopping apps
 - Food delivery apps
-

Waterfall

Used when:

- Requirements are fixed
- Documentation is important
- Process is stable

Example:

- ATM systems
- College management systems
- Government software projects |

4. Stakeholder Management (15 Minutes)

What is a Stakeholder?

Stakeholder is any person involved in or affected by a project.

Examples

- Clients
 - Managers
 - Developers
 - Customers
 - End users
-

Business Analyst Role

Business Analyst:

- Conducts meetings
 - Understands stakeholder needs
 - Gives project updates
 - Manages communication
-

Real-Time Example – Hospital System

Stakeholders:

- Doctors
- Reception staff
- Management
- Developers

Business Analyst collects requirements from all teams.

Skills Students Learn

- Communication
- Requirement gathering
- Problem-solving
- Data analysis basics
- Documentation

- Business understanding

Final Conclusion (5 Minutes)

Key Takeaways

- Business Analyst helps solve business problems
- Communication and analytical thinking are important
- Agile and Waterfall are common methodologies
- Stakeholder management is important for project success
